## Science meets Dharma - Test Speed - Force 2

Name: Date:

1) If the average speed of a man walking at steady pace is $6 \mathrm{~km} / \mathrm{h}$. Express this speed in $\mathbf{m} / \mathbf{s}$.
2) Lobsang hears thunder 10 seconds after he sees lightning. If the speed of sound is $340 \mathrm{~m} / \mathrm{s}$, calculate the distance of the lightning from Lobsang.
3) Complete this table:

|  | S | min | h min | h |
| :---: | :---: | :---: | :---: | :---: |
| a) | S | min | 40h 30min | h |
| b) | 4800 s | min |  | h |
| c) | S | 720 min |  | h |

4) A train travels at $60 \mathrm{~km} / \mathrm{h}$ for $45 \mathrm{~min}, 30 \mathrm{~km} / \mathrm{h}$ for the next 20 min and then $70 \mathrm{~km} / \mathrm{h}$ for the next 50 min .
a) What is the average speed of the train in $\mathrm{km} / \mathrm{h}$ ?
b) Draw a distance-time-graph of the motion of the train
5) The graph given shows the position of a body at different times, calculate the speed of the body as it moves from
a) $\quad \mathrm{A}$ to B
b) $\quad \mathrm{B}$ to C
c) $\quad \mathrm{C}$ to D
6) A toy train runs on a circle of diameter 0.6 m . It takes 5 seconds to make two full
 circles.

What is its speed in $\mathrm{m} / \mathrm{s}$ ?
7) What is inertia? In which unit do we measure it?
8) We have two forces: One of $\mathbf{4 N}$ and one of $\mathbf{6 N}$.
a) What resultant force do we get, when the two forces act in the same direction? What if they act in opposite directions?
b) Add the forces by drawing, when there is an angle of $90^{\circ}$ between them. What is the resultant now? (take a length of 1 cm to represent a force of 1 N )
