

Orion, Canis Major

Orion, the hunter, is a large constellation and some say it is the most beautiful. Its stars are quite bright and have different colours. A mysterious luminous cloud is contained in the constellation, the Orion Nebula. This cloud of gas is illuminated by some stars, some of them are quite young and have been born out of the nebula, when the gases began to concentrate under the influence of the force of gravity.

Her a list of the main stars of Orion:

- Betelgeux (α) 430 light-years away.
 - Rigel (β), 900 light-years away, brightness of 60000 suns, magn. 0.2 (variable)
 - Bellatrix (γ), 240 light-years away, 2200 times as bright as the sun, magn. 1.7
